

Interested in a VoIP phone system?

Due to an increased volume in businesses and organizations working remotely, Right Click Solutions suggests reviewing your current phone system. We recommend using an internet-based VoIP phone system that can be used virtually anywhere internet access is available.

VoIP (Voice Over Internet Protocol) integrates data and voice communications (including cell phones) and costs less per voice call than traditional phone systems, making it an increasingly attractive option for small businesses and non-profit organizations.

Right Click Solutions has partnered with a reputable VoIP phone system which utilizes the internet for all communications. Physical phones can be shipped directly to most locations allowing setup and system management to be handled from an alternate location, allowing for off-site installation and maintenance. With a multitude of plug and play features, VoIP offers a comprehensive solution to all of your communication needs.

Right Click Solutions supports several clients who have invested in VoIP, as well as at our own company, and many appreciate the reliability and versatility of the system. With a VoIP system, staff can take their physical phone to any location that has an internet connection and answer calls as if they were in the office. In addition, calls can be answered via a soft phone app on their computer or smartphone. By choosing features that meet the requirements of your organization, you can create a broadly accessible communication system designed ideally for your business.
